EDUCATION

National University of Sciences and Technology

2024

Bachelor of Software Engineering

Islamabad, PK

Coursework: Data Structures and Algorithms, Object-Oriented Programming, Software Engineering, Web Development, Software Requirement Engineering, Machine Learning, Large Language Models, Mobile Development, etc.

SKILLS - LANGUAGES & FRAMEWORKS

- | | | | |
|--------------|-------------|--------------|----------------|
| ▪ JavaScript | ▪ Express | ▪ NEXT JS | ▪ React Native |
| ▪ Python | ▪ FastAPI | ▪ Postgresql | ▪ MongoDB |
| ▪ LangGraph | ▪ LangChain | ▪ LangFuse | ▪ Git |

WORK EXPERIENCE

Codeaza Technologies

August 2025 - Present

AI Software Engineer

Islamabad, PK

- Addressed the challenge of fragmented and unstructured financial fee data across 40+ global exchanges by architecting an AI-powered fee intelligence platform with 13 microservices, enabling automated fee extraction, change tracking, and structured data delivery to enterprise clients.
- Engineered a config-driven web crawling system using Scrapy, Playwright, and Redis with 13+ exchange-specific handlers and proxy rotation to reliably scrape complex exchange websites (NASDAQ, NYSE, LCH, MEMX, HKEx, FCA), achieving 40+ exchange coverage with zero manual intervention.
- Designed and implemented 7 LangGraph AI agents (GPT-4o, GPT-4o-mini) for fee extraction, validation, change detection, and definition parsing, leveraging Langfuse for prompt management and VoyageAI + Elasticsearch for hybrid vector search, reducing manual fee analysis time by 85%.
- Built an end-to-end document change pipeline using AWS Lambda, SQS, and ECS Tasks to automatically detect, diff, and summarize fee schedule changes, ensuring clients receive updates within hours instead of days.
- Developed a high-performance operations backend (ops-api) with FastAPI, handling 61 services across 9 Celery queues, 65+ SQLAlchemy models, and a robust middleware chain, supporting PDF processing, AI orchestration, and evaluation workflows at scale.
- Built a secure operations portal using Next.js 16, React 19, and TypeScript with httpOnly cookie authentication, HMAC-signed permission cookies, and an API proxy pattern, eliminating token exposure to client-side JavaScript and achieving tamper-proof RBAC across 15+ dashboard modules.
- Resolved scalability bottlenecks in PDF fee extraction by implementing batch processing with LandingAI DPT-2 and Playwright, parallel Celery task execution, and S3-backed result storage, enabling concurrent processing of thousands of fee schedule documents.
- Developed a public-facing RESTful API and SDKs (Python + TypeScript) with RS256 JWT + API key authentication, rate limiting, cursor pagination, and comprehensive Mintlify documentation, enabling enterprise clients to access structured fee data programmatically.
- Implemented a comprehensive evaluation framework using DeepEval metrics to continuously measure AI extraction accuracy, enabling data-driven prompt tuning and agent improvements that increased extraction precision across fee schedule types.

Phish Rod

August 2024 - July 2025

Associate Software Engineer

Lahore, PK

- Optimized back-end data processing by designing and implementing robust solutions with Java and Hibernate ORM, leveraging Dynamic Query in Liferay to streamline database operations, resulting in 30% lower response times.
- Improved system stability and scalability by debugging and enhancing existing Liferay-based systems, ensuring adherence to best practices in the production environment, and reducing system crashes by 10%.
- Identified performance and UX gaps to deliver solutions integrating modern web dev techniques and efficient state management, enabling high-performance applications that increased user session duration by 20%.
- Implemented an RAG-based Cyber Security Consultant chatbot using phi-3.5 large language model and Hugging Face guardrails and embedding to improve users' personalized experience, resulting in a 60% increase in desktop application usage. .
- Addressed scalability and customization challenges made due to legacy codebase and Liferay constraints by combining multiple codebases into a singular structure, reducing development time by 40% and increasing code reusability by 70%.

VAASEL

September 2023 – April 2024

Associate Software Engineer – Part-time

Islamabad, PK

- Implemented a centralized property listing platform to address fragmented property listings, enhancing user accessibility, and streamlining the property browsing experience.
- Designed and developed an agriculture-focused e-commerce platform to improve farmer and manufacturer connections that reduced intermediary reliance, cutting intermediary costs by 30% and improving product availability.
- Enhanced team coordination for a food donation platform and led an agile development team, optimizing collaboration and communication, ensuring zero delays and on-time project delivery.
- Developed a transparent hiring process platform by identifying gaps in human resource management workflows to improve candidate visibility and reduce HR workload by 40 %.
